Pearson Edexcel International Advanced Level
In Chemistry (WCH15)

Paper 01 Unit 5: Transition Metals and Organic
Nitrogen Chemistry

Question number	Answer	Mark
1	<p>The only correct answer is D (zinc)</p> <p><i>A is incorrect because cobalt forms a stable Co^{2+} ion with incompletely-filled d-orbitals</i></p> <p><i>B is incorrect because copper forms a stable Cu^{2+} ion with incompletely-filled d-orbitals</i></p> <p><i>C is incorrect because nickel forms a stable Ni^{2+} ion with incompletely-filled d-orbitals</i></p>	(1)

Question number	Answer	Mark
2	<p>The only correct answer is D (VO_3^- and VO_2^+)</p> <p><i>A is incorrect because chromium has oxidation numbers +6 and +3 respectively</i></p> <p><i>B is incorrect because copper has oxidation numbers +1 and +2 respectively</i></p> <p><i>C is incorrect because manganese has oxidation numbers +3 and +4 respectively</i></p>	(1)

Question number	Answer	Mark
3	<p>The only correct answer is D (6)</p> <p><i>A is incorrect because although there are two different ligands, there are 6 atoms bonded to the central ion</i></p> <p><i>B is incorrect because the charge on Cr is 3+ but there are 6 atoms bonded to the central ion</i></p> <p><i>C is incorrect because although there are 4 ligands, there are 6 atoms bonded to the central ion</i></p>	(1)

Question number	Answer	Mark
4	<p>The only correct answer is C (Ni^{2+})</p> <p><i>A is incorrect because Cu^{2+} gives a blue precipitate with aqueous sodium hydroxide and with aqueous ammonia</i></p> <p><i>B is incorrect because the precipitate formed with Fe^{2+} and aqueous ammonia is insoluble in excess ammonia</i></p> <p><i>D is incorrect because V^{2+} is a purple solution</i></p>	(1)

Question number	Answer	Mark
5	<p>The only correct answer is B ($[\text{Zn}(\text{H}_2\text{O})_6]^{2+} + 2\text{NH}_3 \rightarrow \text{Zn}(\text{OH})_2(\text{H}_2\text{O})_4 + 2\text{NH}_4^+$)</p> <p><i>A is incorrect because the precipitate should not have a positive charge and the charges do not balance</i></p> <p><i>C is incorrect because $[\text{Zn}(\text{NH}_3)_4(\text{H}_2\text{O})_2]^{2+}$ is formed when the precipitate dissolves in excess aqueous ammonia</i></p> <p><i>D is incorrect because $\text{Zn}(\text{NH}_3)_4(\text{H}_2\text{O})_2$ should have a 2+ charge and the equation is not balanced</i></p>	(1)

Question number	Answer	Mark
6	<p>The only correct answer is B (Mn^{2+} acts as a catalyst; concentration of reactants decreases)</p> <p><i>A is incorrect because the kinetic energies of the particles do not change</i></p> <p><i>C is incorrect because MnO_4^- is not a catalyst and the kinetic energies of the particles do not change</i></p> <p><i>D is incorrect because MnO_4^- is not a catalyst</i></p>	(1)

Question number	Answer	Mark
7	<p>The only correct answer is C (ΔS_{total} and $\ln K$)</p> <p><i>A is incorrect because E_{cell}° is not directly proportional to $\Delta_{\text{r}}H$</i></p> <p><i>B is incorrect because E_{cell}° is not directly proportional to $\Delta_{\text{r}}H$ or to $\ln RT$</i></p> <p><i>D is incorrect because E_{cell}° is not directly proportional to $\ln RT$</i></p>	(1)

Question number	Answer	Mark
8	<p>The only correct answer is A (standard reduction potential; most negative to most positive)</p> <p><i>B is incorrect because the electrochemical series has the most negative standard electrode potential first</i></p> <p><i>C is incorrect because standard cell potentials are determined from two standard electrode potentials</i></p> <p><i>D is incorrect because standard cell potentials are determined from two standard electrode potentials and the electrochemical series has the most negative standard electrode potential first</i></p>	(1)

Question number	Answer	Mark
9	<p>The only correct answer is A ($\text{H}_2 + 2\text{OH}^- \rightarrow 2\text{H}_2\text{O} + 2\text{e}^-$)</p> <p><i>B is incorrect because H^+ ions cannot be produced in an alkaline solution</i></p> <p><i>C is incorrect because H^+ ions cannot be produced in an alkaline solution</i></p> <p><i>D is incorrect because H^+ ions cannot be produced in an alkaline solution</i></p>	(1)

Question number	Answer	Mark
10	<p>The only correct answer is B (negative; positive)</p> <p><i>A is incorrect because $E_{\text{cell}}^{\circ} = E_{\text{rhs}} - E_{\text{lhs}}$ so $0.17 - (-0.40) = +0.57 \text{ V}$ or $0.40 - (-0.17) = +0.57 \text{ V}$</i></p> <p><i>C is incorrect because $E_{\text{cell}}^{\circ} = E_{\text{rhs}} - E_{\text{lhs}}$ so $0.17 - (-0.40) = +0.57 \text{ V}$ or $0.40 - (-0.17) = +0.57 \text{ V}$</i></p> <p><i>D is incorrect because $E_{\text{cell}}^{\circ} = E_{\text{rhs}} - E_{\text{lhs}}$ so $0.17 - (-0.40) = +0.57 \text{ V}$ or $0.40 - (-0.17) = +0.57 \text{ V}$</i></p>	(1)

Question number	Answer	Mark
11	<p>The only correct answer is C (magnesium)</p> <p><i>A is incorrect because $1.635 \div 65.4 = 0.025 \text{ mol}$ of zinc produced which gives a relative atomic mass of 24.3 for G</i></p> <p><i>B is incorrect because $1.635 \div 65.4 = 0.025 \text{ mol}$ of zinc produced which gives a relative atomic mass of 24.3 for G</i></p> <p><i>D is incorrect because $1.635 \div 65.4 = 0.025 \text{ mol}$ of zinc produced which gives a relative atomic mass of 24.3 for G</i></p>	(1)

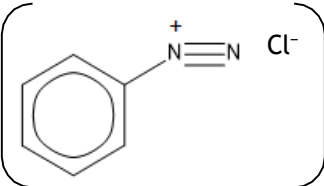

Question number	Answer	Mark
12	<p>The only correct answer is D (phenylamine)</p> <p><i>A is incorrect because the lone pair of electrons on N in ammonia is not delocalised so can be donated more easily</i></p> <p><i>B is incorrect because the lone pair of electrons on N in butylamine is not delocalised so can be donated more easily</i></p> <p><i>C is incorrect because the lone pair of electrons on N in ethylamine is not delocalised so can be donated more easily</i></p>	(1)

Question number	Answer	Mark
13	<p>The only correct answer is B ($\text{H}_2\text{NCH}(\text{CH}_3)\text{COO}^-$)</p> <p><i>A is incorrect because this is the structure of the uncharged molecule</i></p> <p><i>C is incorrect because this structure would exist at pH less than 6.0</i></p> <p><i>D is incorrect because this is the structure of the zwitterion</i></p>	(1)

Question number	Answer	Mark
14	<p>The only correct answer is A ($\text{CH}_2=\text{CHCOOH}$)</p> <p><i>B is incorrect because phenol does not react with ethanol</i></p> <p><i>C is incorrect because 2-propen-1-ol does not react with sodium hydroxide or ethanol</i></p> <p><i>D is incorrect because ethanoic acid does not react with hydrogen in the presence of a nickel catalyst</i></p>	(1)

Question number	Answer	Mark
15(a)	<p>The only correct answer is A (further substitution by a nitro group occurs)</p> <p><i>B is incorrect because nitrobenzene does not decompose at 80°C</i></p> <p><i>C is incorrect because fuming sulfuric acid is needed for the substitution of SO₃H</i></p> <p><i>D is incorrect because nitric acid does not decompose at 80°C</i></p>	(1)

Question number	Answer	Mark
15(b)	<p>The only correct answer is C (Sn and concentrated HCl(aq) are added first, then NaOH(aq) is added at the end)</p> <p><i>A is incorrect because the acid and alkali would react to form a salt if they are added together</i></p> <p><i>B is incorrect because the acid and alkali would react to form a salt if they are added together</i></p> <p><i>D is incorrect because dilute hydrochloric acid would not react quickly enough with the tin</i></p>	(1)

Question number	Answer	Mark
15(c)	<p>The only correct answer is B</p>  <p><i>A is incorrect because the chlorine is not bonded covalently to the nitrogen</i></p> <p><i>C is incorrect because the chlorine is not bonded covalently to the nitrogen</i></p> <p><i>D is incorrect because the charge should be on the nitrogen on the right not the nitrogen on the left</i></p>	(1)

Question number	Answer	Mark
15(d)	<p>The only correct answer is B (alkaline)</p> <p><i>A is incorrect because a phenoxide ion is needed for the reaction and that is produced in alkaline solution</i></p> <p><i>C is incorrect because a phenoxide ion is needed for the reaction and that is produced in alkaline solution</i></p> <p><i>D is incorrect because a phenoxide ion is needed for the reaction and that is produced in alkaline solution</i></p>	(1)

Question number	Answer	Mark
16	<p>The only correct answer is D (8 cm³))</p> <p><i>A is incorrect because 2 cm³ of methane reacts with 4 cm³ of oxygen</i></p> <p><i>B is incorrect because 4 cm³ of methane would react with 4 cm³ of oxygen if they reacted in a 1:1 mole ratio</i></p> <p><i>C is incorrect because 6 cm³ would be the volume of argon if methane reacted with oxygen in a 1:1 mole ratio</i></p>	(1)

Question number	Answer	Mark
17	<p>The only correct answer is A (x is 30 and y is 40)</p> <p><i>B is incorrect because water is a liquid at room temperature</i></p> <p><i>C is incorrect because 10 cm³ of but-1-ene reacts with 60 cm³ of oxygen to form 40 cm³ of carbon dioxide so there is an initial decrease of 30 cm³</i></p> <p><i>D is incorrect because 10 cm³ of but-1-ene reacts with 60 cm³ of oxygen to form 40 cm³ of carbon dioxide so there is an initial decrease of 30 cm³ and water is a liquid at room temperature</i></p>	(1)

(Total for Section A = 20 marks)

Section B

Question Number	Answer	Additional Guidance	Mark
18(a)	<p>Hydrogen half-cell:</p> <ul style="list-style-type: none"> (M1) 1 mol dm⁻³ H⁺(aq) and platinum (black) electrode (1) (M2) hydrogen gas in suitable apparatus at 100 kPa / 1 × 10⁵ Pa (at 298 K) (1) <p>Copper half-cell:</p> <ul style="list-style-type: none"> (M3) copper (electrode) dipping into solution (1) (M4) 1 mol dm⁻³ Cu²⁺ (solution) (1) <p>Connections:</p> <ul style="list-style-type: none"> (M5) salt bridge (dipping into /touching both solutions) and voltmeter and complete circuit (1) 	<p>Example of diagram:</p> <p>Allow hydrogen half-cell drawn on the right Concentration only needed once in M1 and M4 if both are 1 mol dm⁻³ Allow 1 mol dm⁻³ hydrochloric acid / HCl / nitric acid / HNO₃ Allow 0.5 mol dm⁻³ sulfuric acid / H₂SO₄ Do not award just 1 mol but only penalise once in M1 and M4</p> <p>Accept 101 kPa / 1.01 × 10⁵ Pa / 1 atmosphere pressure Allow 1 bar pressure Do not award other temperatures</p> <p>Ignore references to anode/cathode</p> <p>Allow any soluble named copper(II) salt e.g. copper(II) sulfate / CuSO₄ / copper(II) nitrate / Cu(NO₃)₂ / copper(II) chloride / CuCl₂</p> <p>Allow salt bridge drawn and labelled just with the electrolyte e.g. potassium, sodium or ammonium nitrate, chloride or sulfate</p> <p>Do not award M5 if the circuit is incorrect e.g. a cell or ammeter instead of voltmeter or incorrect compounds such as KOH/HNO₃ in salt bridge</p>	(5)

Question Number	Answer	Additional Guidance	Mark
18(b)(i)	<p>An explanation that makes reference to the following points:</p> <p>(concentrated hydrochloric acid)</p> <ul style="list-style-type: none"> increases the concentration of H^+ ions in the first equilibrium (and displaces it to the right) so increases the value of $E / E > 1.33 \text{ (V)}$ <p>(concentrated hydrochloric acid)</p> <ul style="list-style-type: none"> increases the concentration of chloride ions in the second equilibrium (and displaces it to the left) so decreases the value of $E / E < 1.36 \text{ (V)}$ <ul style="list-style-type: none"> the difference between 1.33 and 1.36 is (very) small and so using concentrated hydrochloric acid, E_{cell} will be positive (so the reaction occurs) 	<p>Ignore any references to E_a/energy</p> <p>Allow just ‘when $[\text{H}^+]$ increases the first equilibrium shifts to the right’</p> <p>Allow because the coefficient for H^+ is 14, the position of equilibrium is very sensitive to the concentration of H^+</p> <p>Allow just ‘when $[\text{Cl}^-]$ increases the second equilibrium shifts to the left’</p> <p>There must be some indication of the equilibrium referred to but can simply be $\text{Cl}_2:2 \text{Cl}^-$</p> <p>Allow answer in terms of first E^\ominus increasing (above 1.36 (V)) or second E^\ominus decreasing (below 1.33(V)) so E_{cell} will be positive for M3</p> <p>Allow chlorine escapes and displaces second equilibrium to the left and decreases E^\ominus decreasing below 1.33 (V) so E_{cell} will be positive</p> <p>Ignore references to anode/cathode</p>	(3)

Question Number	Answer	Additional Guidance	Mark
18(b)(ii)	<p>(1)</p> <ul style="list-style-type: none"> left hand side of cell diagram <p>(1)</p> <ul style="list-style-type: none"> central vertical lines and right hand side of cell diagram 	<p>Example of cell diagram: $\text{Pt(s)} 2\text{Cl}^-(\text{aq}) \text{Cl}_2(\text{g}) [\text{Cr}_2\text{O}_7^{2-}(\text{aq}) + 14\text{H}^+(\text{aq})], [2\text{Cr}^{3+}(\text{aq}) + 7\text{H}_2\text{O(l)}] \text{Pt(s)}$</p> <p>Allow comma between Cl^- and Cl_2 Do not award missing molar ratio but penalise once only</p> <p>Allow dotted / dashed vertical lines in the cell junction of the cell diagram Allow comma between dichromate ion and proton Allow vertical line between protons and chromium(III) ions Ignore missing / incorrect state symbols Ignore omission of water Ignore missing brackets/use of rounded brackets</p> <p>Penalise inclusion of electrons once only</p> <p>If no other mark is awarded, allow (1) for whole cell diagram written in reverse If no other mark is awarded, allow (1) for electrodes on correct sides but 2Cl^- and Cl_2 in reverse order and / or 2Cr^{3+} and $\text{Cr}_2\text{O}_7^{2-} + 14\text{H}^+$ in reverse order</p> <p>Award (1) if Pt(s) missing both sides but all otherwise correct</p>	(2)

Question Number	Answer	Additional Guidance	Mark
18(c)	<ul style="list-style-type: none"> calculation of mol MnO_4^- and X_2O_5 (1) deduction of mol ratio (1) final oxidation number of X (1) 	<p>Example of calculation:</p> $\text{mol MnO}_4^- = \frac{50.0 \times 0.02}{1000} = 0.001 / 1.00 \times 10^{-3}$ <p>and</p> $\text{mol X}_2\text{O}_5 = \frac{25.0 \times 0.1}{1000} = 0.0025 / 2.5 \times 10^{-3}$ <p>or</p> $\text{mol X} = \frac{25.0 \times 0.1 \times 2}{1000} = 0.0050 / 5 \times 10^{-3}$ <p>mol ratio X : MnO_4^- is 5 : 1</p> <p>Allow calculation of moles of electrons per Mn and per X giving $5 \times 10^{-3} : 5 \times 10^{-3}$</p> <p>(there are 5 electrons in the MnO_4^- half-equation so X's oxidation number decreased by 1 to (+) 4</p> <p>Allow X^{+4}</p> <p>Allow TE of oxidation number (+) 3 from 5 : 2 ratio or from $5 \times 10^{-3} \div 2.5 \times 10^{-3} = 2$ so $+5 - 2 = (+)3$</p> <p>Award (3) for oxidation number (+) 4 provided some working such as number of moles for M1</p>	(3)

(Total for Question 18 = 13 marks)

Question Number	Answer	Additional Guidance	Mark												
19(a)	<ul style="list-style-type: none"> calculation of mol of K, Fe and O deduction of mol ratio and empirical formula <p>Alternative method</p> <ul style="list-style-type: none"> calculation of M_r value deduction of elemental values and empirical formula 	<p>Example of calculation:</p> <table border="1"> <tr> <td></td><td>K</td><td>Fe</td><td>O</td></tr> <tr> <td>mol</td><td>$\frac{39.5}{39.1} = 1.01$</td><td>$\frac{28.2}{55.8} = 0.505$</td><td>$\frac{32.3}{16} = 2.02$</td></tr> <tr> <td>ratio</td><td>2</td><td>1</td><td>4</td></tr> </table> <p>Empirical formula is K_2FeO_4 Accept symbols in any order</p> <p>Allow use of 39 as A_r of K, 56 as A_r of Fe and 0.504 as mol of Fe Allow TE for M2 from candidates own moles Correct empirical formula with no working scores (2)</p> <p>If one or two atomic numbers are used then allow TE as appropriate for (1)</p> <p>$M_r = (\text{Atomic mass} \div \text{element percentage}) \times 100$ e.g. $M_r = (55.8 \div 28.2) \times 100 = 197.87 / 197.9 / 198$</p> <p>$K = (39.5 \div 100) \times 198 = 78.2$ so 2K $Fe = (28.2 \div 100) \times 198 = 55.8$ so 1Fe $O = (32.3 \div 100) \times 198 = 64$ so 4O Empirical formula is K_2FeO_4</p>		K	Fe	O	mol	$\frac{39.5}{39.1} = 1.01$	$\frac{28.2}{55.8} = 0.505$	$\frac{32.3}{16} = 2.02$	ratio	2	1	4	(2)
	K	Fe	O												
mol	$\frac{39.5}{39.1} = 1.01$	$\frac{28.2}{55.8} = 0.505$	$\frac{32.3}{16} = 2.02$												
ratio	2	1	4												

Question Number	Answer	Additional Guidance	Mark
19(b)(i)	<p>An answer that makes reference to the following point:</p> <ul style="list-style-type: none"> reaction between two negative ions is slow due to repulsion 	<p>Allow negative species for negative ions Allow just 'the negative ions repel' Ignore references to unlikelihood of three negative ions colliding Do not award negative molecules</p>	(1)

Question Number	Answer	Additional Guidance	Mark
19(b)(ii)	<ul style="list-style-type: none"> ionic equation involving iron(II) (1) ionic equation involving iron(III) (1) 	<p><u>Examples of ionic equations</u> $2\text{Fe}^{2+} + \text{S}_2\text{O}_8^{2-} \rightarrow 2\text{Fe}^{3+} + 2\text{SO}_4^{2-}$ $2\text{Fe}^{3+} + 2\text{I}^- \rightarrow 2\text{Fe}^{2+} + \text{I}_2$</p> <p>Award (1) for balanced equations given in reverse order Allow (1) for two unbalanced equations with all species paired correctly Ignore state symbols even if incorrect</p>	(2)

Question Number	Answer	Additional Guidance	Mark
19(c)(i)	<p>An explanation that makes reference to the following points:</p> <ul style="list-style-type: none"> because it forms one dative (covalent) / co-ordinate bond (to Fe^{2+}) (1) using a lone pair (of electrons) on oxygen (1) 	<p>Allow 'a dative/co-ordinate bond'</p> <p>Allow oxygen donates a pair of electrons</p> <p>Ignore water uses a lone pair of electrons</p>	(2)

Question Number	Answer	Additional Guidance	Mark
19(c)(ii)	<p>An explanation that makes reference to the following points:</p> <ul style="list-style-type: none"> octahedral because there are six pairs of electrons (1) which are as far apart as possible to minimise repulsion (1) 	<p>Allow this shown on a diagram</p> <p>Allow octahedral because there are 6 coordinate bonds/coordination number is 6</p> <p>Ignore just octahedral because there are 6 ligands</p> <p>Do not award if bond angle other than 90° / 90° and 180° stated</p> <p>Allow repel/arrange/shape to maximum separation</p> <p>Do not allow repulsion between atoms or water molecules or ligands</p>	(2)

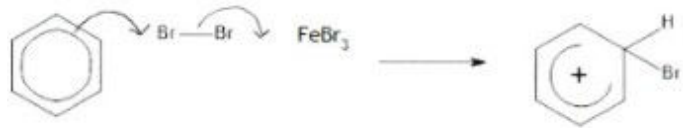

Question Number	Answer	Additional Guidance	Mark
19(d)	<p>An explanation that makes reference to the following points:</p> <ul style="list-style-type: none"> carbon monoxide replaces / takes the place of the oxygen molecule / ligand (1) (and it may be toxic) because it binds strongly to the Fe^{2+} ion (1) 	<p>Accept ligand substitution / exchange reaction between oxygen and carbon monoxide COMMENT The question refers to oxygen being carried around and so there needs to be explicit reference and not just implied that to it being replaced/substituted or its place being taken</p> <p>Allow carbon monoxide forms a stronger bond to Fe^{2+} (than oxygen)</p> <p>Allow carbon monoxide binds (almost) irreversible / permanently to Fe^{2+}</p> <p>Allow carbon monoxide forms a more stable complex ion with Fe^{2+} / the complex formed has a larger equilibrium constant</p> <p>Allow prevents / reduces the amount of oxygen being carried to the cells / organs / around the body / blood – scores M2 not M1</p> <p>Allow just carbon monoxide binds more strongly to haemoglobin/globin</p>	(2)

Question Number	Answer	Additional Guidance	Mark
19(e)	<p>An explanation that makes reference to the following points:</p> <ul style="list-style-type: none"> there are more particles / moles on the right (of the equation or there is an increase from 3 particles / moles / species on the left of the equation to 5 on the right so ΔS_{system} increases / is positive (and the reaction is thermodynamically feasible) 	<p>Allow species for particles Do not award reference to molecules / atoms / compounds</p> <p>(1) Do not award incorrect numbers</p> <p>(1) Allow ΔS_{total} is positive / increasing (and the reaction is thermodynamically feasible)</p> <p>Allow there is an increase in entropy (and the reaction is thermodynamically feasible)</p> <p>Ignore references to increases in disorder</p>	(2)

Question Number	Answer	Additional Guidance	Mark

Question Number	Acceptable Answers	Additional Guidance	Mark																				
20(a)(ii)*	<p>This question assesses a student’s ability to show a coherent and logically structured answer with linkages and fully-sustained reasoning.</p> <p>Marks are awarded for indicative content and for how the answer is structured and shows lines of reasoning.</p> <p>The following table shows how the marks should be awarded for indicative content.</p> <table><tr><th>Number of indicative marking points seen in answer</th><th>Number of marks awarded for indicative marking points</th></tr><tr><td>6</td><td>4</td></tr><tr><td>5–4</td><td>3</td></tr><tr><td>3–2</td><td>2</td></tr><tr><td>1</td><td>1</td></tr><tr><td>0</td><td>0</td></tr></table> <p>The following table shows how the marks should be awarded for structure and lines of reasoning.</p> <table><tr><th></th><th>Number of marks awarded for structure of answer and sustained line of reasoning</th></tr><tr><td>Answer shows a coherent and logical structure with linkages and fully sustained lines of reasoning demonstrated throughout.</td><td>2</td></tr><tr><td>Answer is partially structured with some linkages and lines of reasoning.</td><td>1</td></tr><tr><td>Answer has no linkages between points and is unstructured.</td><td>0</td></tr></table> <p>Comment: Look for the indicative marking points first, then consider the mark for structure of answer and sustained line of reasoning</p>	Number of indicative marking points seen in answer	Number of marks awarded for indicative marking points	6	4	5–4	3	3–2	2	1	1	0	0		Number of marks awarded for structure of answer and sustained line of reasoning	Answer shows a coherent and logical structure with linkages and fully sustained lines of reasoning demonstrated throughout.	2	Answer is partially structured with some linkages and lines of reasoning.	1	Answer has no linkages between points and is unstructured.	0	<p>Guidance on how the mark scheme should be applied: The mark for indicative content should be added to the mark for lines of reasoning. For example, an answer with five indicative marking points that is partially structured with some linkages and lines of reasoning scores 4 marks (3 marks for indicative content and 1 mark for partial structure and some linkages and lines of reasoning). If there are no linkages between points, the same five indicative marking points would yield an overall score of 3 marks (3 marks for indicative content and no marks for linkages).</p> <p>In general it would be expected that 5 or 6 indicative points would get 2 reasoning marks, and 3 or 4 indicative points would get 1 mark for reasoning, and 0, 1 or 2 indicative points would score zero marks for reasoning.</p> <p>General points to note If there is any incorrect chemistry, deduct mark(s) from the reasoning. If no reasoning mark(s) awarded do not deduct mark(s).</p> <p>Accept structures for names throughout If name and formula given both must be correct</p> <p>Deduct a reasoning mark if there is no comparison given for IP1 to IP3 Do not penalise unbalanced / incomplete equations Deduct (mark) from reasoning if any products given are incorrect</p>	(6)
Number of indicative marking points seen in answer	Number of marks awarded for indicative marking points																						
6	4																						
5–4	3																						
3–2	2																						
1	1																						
0	0																						
	Number of marks awarded for structure of answer and sustained line of reasoning																						
Answer shows a coherent and logical structure with linkages and fully sustained lines of reasoning demonstrated throughout.	2																						
Answer is partially structured with some linkages and lines of reasoning.	1																						
Answer has no linkages between points and is unstructured.	0																						

<p>Indicative content</p> <ul style="list-style-type: none"> • IP1 – Similarity All are attacked by / react with electrophiles • IP2 – Types of reaction Cyclohexene undergoes addition reactions but benzene and/or phenol undergo substitution reactions • IP3 – Conditions Cyclohexene and/or phenol react with (aqueous) bromine / without a catalyst and benzene needs (a Friedel-Crafts catalyst / iron / iron(III) bromide) • IP4 – Benzene Benzene has delocalised electrons and is (kinetically) stable so the reaction has a high activation energy • IP5 – Cyclohexene Cyclohexene has localised electron density in one π bond (which increases the electron density and makes it more susceptible to electrophilic attack) • IP6 – Phenol Phenol has a lone pair of electrons on the oxygen which is delocalised (within the ring) and makes it more susceptible to electrophilic attack 	<p>All three need to be mentioned for this IP – evidence for phenol reacting with an electrophile may be seen in IP6</p> <p>Accept benzene forms monobromo product / bromobenzene, cyclohexene forms dibromo product / 1,2-dibromocyclohexane and phenol forms tribromo product / 2, 4, 6-tribromophenol Allow HBr is produced with benzene and phenol but cyclohexene only forms one product</p> <p>Allow react under normal laboratory conditions / room temperature and pressure Allow reference to $\text{AlBr}_3/\text{AlCl}_3$ This IP can be awarded if benzene equation has catalyst and other equation(s) do not Ignore references to specific temperatures</p> <p>Allow delocalised (π) electron ring in benzene is (very) stable Allow delocalisation of electrons in π bonds which decreases the electron density (of the ring) and makes it less susceptible to electrophilic attack</p> <p>If neither IP4 or IP5 awarded then allow (1) for benzene has delocalised electrons but cyclohexene does not</p> <p>Allow the lone pair (of electrons) on the oxygen/OH in phenol and increases the electron density of the (benzene) ring/overlaps with the delocalised ring</p>
