	Notes	
(a) **B1**	Both values correct with or without working seen, may be in the expression. Ignore incorrect working.	
(b) **M1**	Show sufficient terms to demonstrate the cancelling. Require at least one cancelling term seen. Must start at r = 5 - M0 if starting at e.g r = 1 unless there is a full process to complete the difference method (same condition) **and** apply f(n) − f(4)	
A1	Extract the two correct terms, or in the Alt obtains a correct overall expression.	
M1	Write the terms with a (non-zero) common denominator with at least numerator correct for their terms. Not dependent - may be scored following M0 if no cancelling terms were shown, but must have had exactly two terms to combine from differences.	
A1	Correct answer in the required form or accept correct values stated following an unsimplified form. (Allow as long as correct terms were extracted, even if no cancelling terms were shown.) Note: this means M0A0M1A1 can be scored for answers which show only the last two lines of the scheme with no cancelling process shown. Note: if e.g. r is used in place of n allow full marks if recovered, but A0 if left in terms of r.

	Notes
(a) **M1**	For a correct **algebraic** method to find the intersection points of $y=x-5$ and $y=\dfrac{9}{x+3}$. May set these equal and form a quadratic and solve. May multiply through by $(x+3)^2$ and collect on one side or use any other valid method Eg work from $\dfrac{(x+3)(x+2)-12}{x+3}>0$ Answers only from a calculator score M0. Must reach at least a quadratic or cubic before answers given. Do not be concerned with the equality or inequality for this mark.
A1	For 6, −4 obtained via a valid algebraic method.
B1	for the CV -3 seen anywhere
dM1	Obtaining (any) inequalities using all of their critical values and no other numbers.
A1	For at least one correct interval allowing for … or ,, used instead of < and >
A1cso	Both correct ranges and no extras. Use of … or ,, scores A0. May be written in set notation, and all work should have been correct so penalise if incorrect inequalities method was used at the start. Accept $x<-4$ and/or $-3<x<6$ with "and" or "or" For candidates who draw a sketch graph and follow with the cvs without any algebra shown only the **B** mark is available. **Those who use some algebra** after their graph may gain marks as earned (possibly all)
(b) **B1ft**	For the "$x<6$" in some form with the possible exception of the CVs from (a). Allow x ,, 6 if already penalised in (a). It is essentially for realising all the extra (valid) values less than −3 are solutions while retaining all their given solutions. If only the CVs themselves are excluded allow B1. Follow through their answer to (a).
B1	Fully correct answer. May give as intervals $x<-3, -3<x<6$

	Note Answers only with no working score no marks as the "hence" has not been used. But if the first M1A1 gained then dM1 may be implied by a correct answer.
M1	Use substitution $x = \sin\theta$ and attempts to use the result from (a) to obtain a value for $\sin 5\theta$
A1	Correct value for $\sin 5\theta$
dM1	Proceeds to apply arcsin and divide by 5 to obtain at least one value for θ. Note for $\sin 5\theta = \frac{1}{5}$ the values you may see are the negatives of the true answers. FYI: $(5\theta = -11.53...,191.53..., 348.46..., 551.53..., 708.46..., 911.53...)$ (Or in radians $-0.201\ldots$ 3.3428..., 6.0819..., 9.6260..., 12.365..., 15.909…)
A1	Proceeds to take sin and achieve at least 2 different correct values for x or $\sin\theta$
A1	For all 5 values of x or $\sin\theta$ awrt 3 d.p. (allow 0.62 and – 0.04)
(c)	
M1	Use previous work to change the integrand into a function that can be integrated
A1	Correct result after integrating. Any limits shown can be ignored
dM1	Substitute given limits, subtracts and uses exact numerical values for trig functions
A1	Final answer correct (oe provided in the given form)
